Introduction

The main problem that our application is aiming to resolve is the long time wasting lines at the time to buying a ticket on a cinema physically, even worse when there is a premiere of a movie and the line times are insufferable, previous solution that served us as inspiration for our application are Cinemark and Cinecolombia, these theaters have their own app and website that allow the registered users to buy tickets, managing their purchase and have access to exclusive offers, the main challenge is to make our app to stand amng the other this would be achieved by giving better memberships and offers that benefits more the users of our application.

Goal

- The main goal is to achieve to have an application where the users could make in a fast and easy way a purchase of a ticket for a movie, while giving them tempting offers that would make them choose our application over others.
- The expected final product is an application that allow the users to register, have their own account with which they could manage their memberships and different offers and obviously allowing the to purchase in a very fast and easy way the tickets for the movie that they want.

Proposed Solution

This is the application that with the help of the design patterns allow the users to register, login, manage their membership, add items to their cart and make the purchase through two services.

Results

Apps/Features	Register/Login Users	Movies on Billboard	Available Seats	Cart	Exclusive Membership	Manage Membership	Dynamic Pricing
CineMacondo							
Other Cinema Apps							

We offer an application with some exclusive features that other cinema apps may don't have making our app more attractive to the final users , this by our membership system that allows to give special prices to the users who activate a membership that is exclusively to the app.

Conclusions

We achieved the main goal by using different design patterns [1], these are different solutions for common problems, they also help with the optimization of the application. Also all of the project could be tested in a fast way thanks to the use of postman [2] an API for development that helps to build, modify and test APIs, in our case we used for testing the HTTP requests mainly GET and POST. These two helped us so much to make the final application as it is and achieve the main goal that we had.
